Description

The problem tree analysis is a commonly used tool in development projects. It is a participatory planning method that helps to establish cause and effect between the various layers of the overall problem being addressed. Doing this will allow project participants to hone in on a feasible project objective while choosing a strategy that actually addresses the specific needs of the beneficiaries.

Objectives

- Raising awareness of the situation
- Recognizing system complexity
- Problem identification
- Strategy formulation
- Sharing perspectives and encouraging openness
- Building a shared vision and goals
